400 COFFEE

Customer Experience Implementation Specification

VERSION 1.1 | 06 NOVEMBER 2026 | CUSTOMER EXPERIENCE UPDATE

Detailed design, interaction, content, motion, responsive and integration requirements.

400 Coffee — Customer Experience Implementation Specification (v1.1)

Product statement

A cinematic, interactive Virtual Café that guides a guest through a warm café entrance, a 3D manager greeting, a vintage diary menu, product customization, guest checkout, payment selection and order confirmation. Customer side only.

Journey map

Entrance → choose Menu or Pay Bill.

Menu → category → product → customize → add to basket → continue shopping or basket.

Basket → customer name/mobile/consent → final review.

Review → Pay now → payment method → provider handoff → verified result → confirmation.

Review → Pay at takeaway → create unpaid order → confirmation with due-at-counter.

Pay Bill → secure reference + phone verification → server outstanding balance → payment provider → verified result/receipt.

Screen specification

CX-01 Entrance

Café environment, 3D manager behind counter, greeting, two primary CTAs.

Camera entrance must settle and allow skip; no interaction is gated by animation.

Show branded loading and 2D fallback; support reduced motion.

Manager dialogue is scripted and context-aware; no pretend AI.

CX-02 Pay bill

Bill/order reference and mobile verification.

Server returns balance and bill status. No arbitrary amount entry in production.

States: loading, not found, verification failed, already paid, partial balance, payment available.

CX-03 Diary menu

Leather-bound menu metaphor with categories, product images, descriptions, prices and availability.

Responsive mobile adaptation; category changes preserve basket.

Search is optional but useful for larger menus.

CX-04 Product customization

Dynamic variants, modifiers, quantity, notes and price deltas.

Show unavailable/invalid combination states.

Data-driven schema; no assumptions that all items have the same options.

CX-05 Basket

Editable lines, quantities, variants, extras, notes, taxes/fees/discounts, server quote.

Preserve basket during back navigation and session refresh where safe.

CX-06 Identity and consent

Guest name/mobile; Indian mobile validation.

Transactional WhatsApp consent distinct from marketing consent.

Explain purpose and store consent audit record.

CX-07 Review

Full order summary and price breakdown.

Explicit confirmation; back/edit retains details.

Fulfilment choices only from outlet config.

CX-08 Payment choice

Pay now or pay at takeaway counter.

Pay later creates an unpaid order, never paid.

CX-09 Payment

Configured UPI, QR, credit/debit card options only.

Provider hosted checkout/dynamic QR/deep link/terminal.

Server-verified payment; pending/failure/expiry/retry states.

CX-10 Confirmation/status

Public order reference, submitted/awaiting acceptance/accepted/preparing/ready states.

Paid only after verified payment. Pay-later due state prominent.

WhatsApp message status accurately displayed.

Character and cinematic direction

3D human-like but stylized enough to avoid uncanny valley; warm, welcoming café manager in dark apron with 400 Coffee branding.

Idle animation: breathing, blinking, small posture/hand movements. Greeting gesture is short and natural.

Camera: one optional slow dolly-in from café entrance toward counter; settle before choices.

Do not animate camera while user types, chooses products or pays.

Environment: walnut counter, espresso machine, brass menu details, shelves, amber pendants, soft warm bounce, slight steam.

Use optimized models, baked lighting, compressed textures and adaptive quality.

Always provide 2D fallback and skip intro.

Motion timing guidance

Entrance camera: 1.5–3 seconds, user can skip.

Scene settle: 200–400 ms.

Diary page transition: 250–450 ms.

Add-to-basket feedback: 120–200 ms.

Checkout transition: under 250 ms; no long cinematic delays.

Reduced motion: immediate state changes and static character/environment.

Responsive layout

360×800 and 390×844: single-column flow, bottom action zone, safe-area aware, no horizontal scroll.

768×1024: hybrid scene/menu layout.

1440×900: cinematic full-width entrance; diary can use two-page spread.

Maintain accessible focus, labels, 44px minimum touch target where feasible and clear price/status contrast.

Data contract essentials

Menu product: id, name, description, image, category, availability, basePrice, currency, variants[], modifiers[], preparationOptions[], allergenMetadata (approved only), station routing (internal).

Quote: currency, lineItems[], subtotal, taxes[], fees[], discounts[], payableTotal, quoteVersion, expiresAt.

Order: publicReference, outlet, customer, fulfilment, items[], quoteSnapshot, orderStatus, paymentStatus, createdAt.

Payment: provider, providerIntentId, expectedAmount, currency, paymentStatus, verifiedAt, eventReference, failureReason.

Consent: purpose, status, capturedAt, wordingVersion, source.

All price and status fields returned by server are authoritative.

Proposed dialogue

Entrance: “Welcome to 400 Coffee. How can I help you today?”

Menu: “Take a look through our café journal. Something good is waiting.”

Customization: “Would you like to make it a little more yours?”

Review: “Lovely choice. Does everything look right?”

Payment: “Would you like to pay now, or at the takeaway counter?”

Pay later: “Perfect. We’ll send your order to the café. You can settle the bill at the takeaway counter.”

Payment pending: “We’re checking your payment. Please don’t pay again just yet.”

Confirmed: “Thank you. Your order is with our café team.”
