Customer Journey Acceptance Test Plan

VERSION 1.1 | 06 NOVEMBER 2026 | CUSTOMER EXPERIENCE UPDATE

Release gates and test scenarios for customer-side build.

400 Coffee — Customer Journey Acceptance Test Plan (v1.1)

P0: order and payment correctness

1. Customer can submit a valid guest order with one or more items.
2. Server-calculated amount is displayed; manipulated client totals are rejected.
3. Duplicate taps, retries and network reconnect do not create duplicate orders.
4. Pay-at-counter order is created with payment due/unpaid.
5. Payment is never marked paid from a browser-only callback, screenshot or static QR.
6. Verified payment amount, currency and order reference match before PAID.
7. Failed, pending, expired and duplicate webhook events are handled idempotently.
8. WhatsApp outage never deletes or blocks a durable order.
9. Customer order status distinguishes submitted, awaiting acceptance, accepted, preparing, ready and completed.
10. Bill lookup does not expose another customer's bill or allow arbitrary amount payment.

P1: experience quality and resilience

11. 3D entrance works on supported device; skip intro is always available.
12. WebGL failure/reduced-motion mode provides full 2D ordering journey.
13. Menu categories, product details and prices are backend-driven.
14. Modifiers, quantities and preparation notes persist through review and order creation.
15. Unavailable items and changed prices require a fresh quote/reconfirmation.
16. Back/edit retains customer and basket data.
17. WhatsApp transactional consent is captured and marketing consent is separate.
18. Customer can recover order status after refresh/reconnect.
19. UI works at 360×800, 390×844, 768×1024 and 1440×900 without horizontal overflow.
20. Keyboard, screen-reader, focus, contrast and reduced-motion checks pass.

P2: polish

21. Camera and diary transitions are smooth but never delay ordering.
22. Manager gestures and facial animation are subtle and coherent.
23. Product photography and menu typography are visually consistent.
24. Loading, empty, error, retry and success states are designed.
25. Analytics events contain no raw phone numbers or sensitive customer content.

Test evidence

For each case record build hash, environment, browser/device, steps, expected result, actual result, screenshot/video evidence, defect ID and pass/fail. Payment cases must use provider sandbox or a clearly marked manual-verification test harness. Never use real card details in automated tests.
