A café experience worth stepping into.

An immersive, guided customer journey — from the first welcome to the final order confirmation.

CUSTOMER EXPERIENCE • ORDERING • PAYMENTS • OPERATIONS HANDOFF

Make ordering feel like entering the café.

A memorable front door can still be fast, clear and operationally reliable.

A better first impression

A cinematic arrival and a welcoming café manager bring the 400 Coffee brand to life.

A guided choice

Customers are led naturally into the diary menu or directly to bill payment.

A dependable transaction

The same journey connects to order acceptance, payment verification and customer updates.

A cinematic welcome, not another QR landing page.

The manager greets the guest and offers two clear paths.

THE FIRST MOMENT

“Welcome to 400 Coffee. How can I help you today?”

- View menu & place order
- Pay bill

A skip-intro and reduced-motion option keeps the experience accessible.

A vintage café diary becomes the menu.

A tactile, editorial menu experience, powered by live café catalog data.

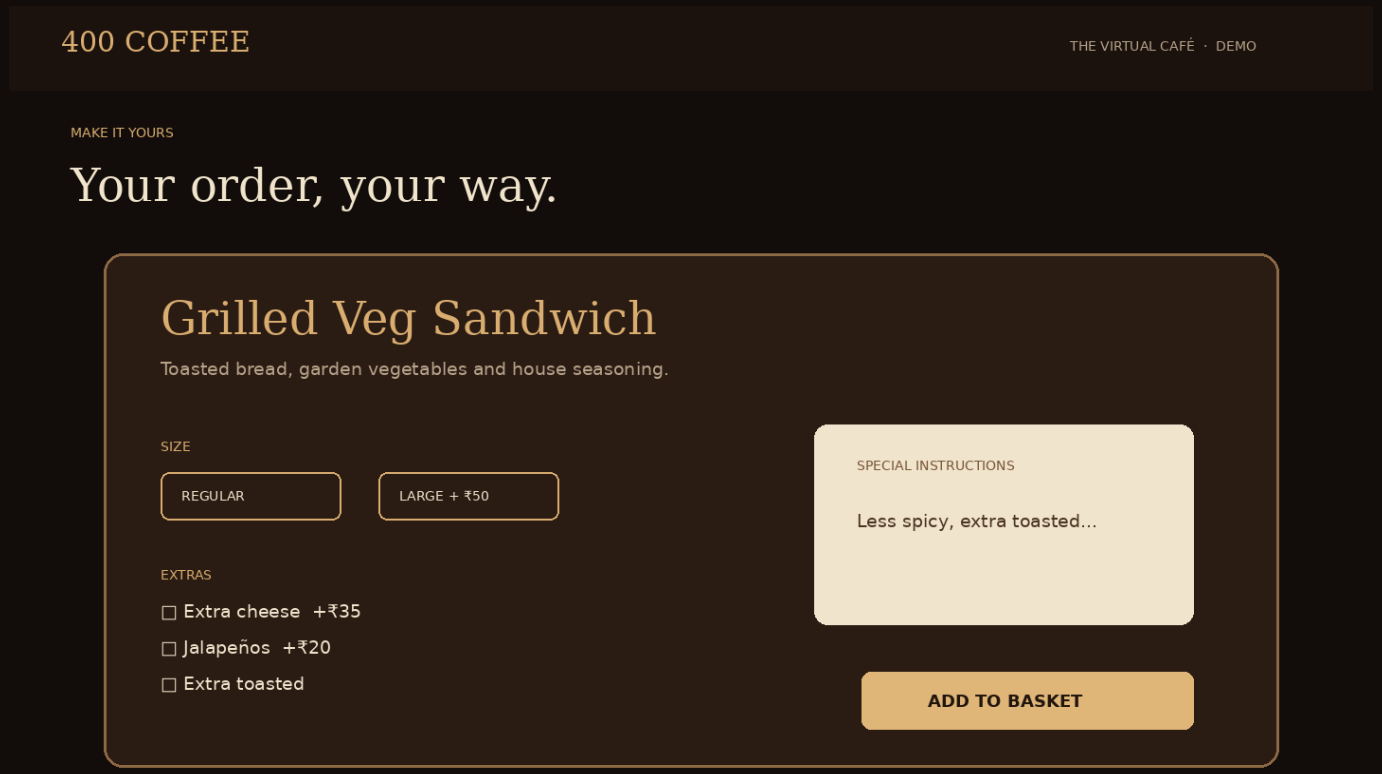

THE MENU EXPERIENCE

- Categories: coffee, hot and cold beverages, juices, sandwiches, snacks and desserts.
- Product photos, descriptions, availability and live prices.
- Category navigation and a persistent basket.
- Menu content remains configurable by the café.

Every order can be made personal.

Variants, add-ons, quantity and preparation notes are reflected in the final order.

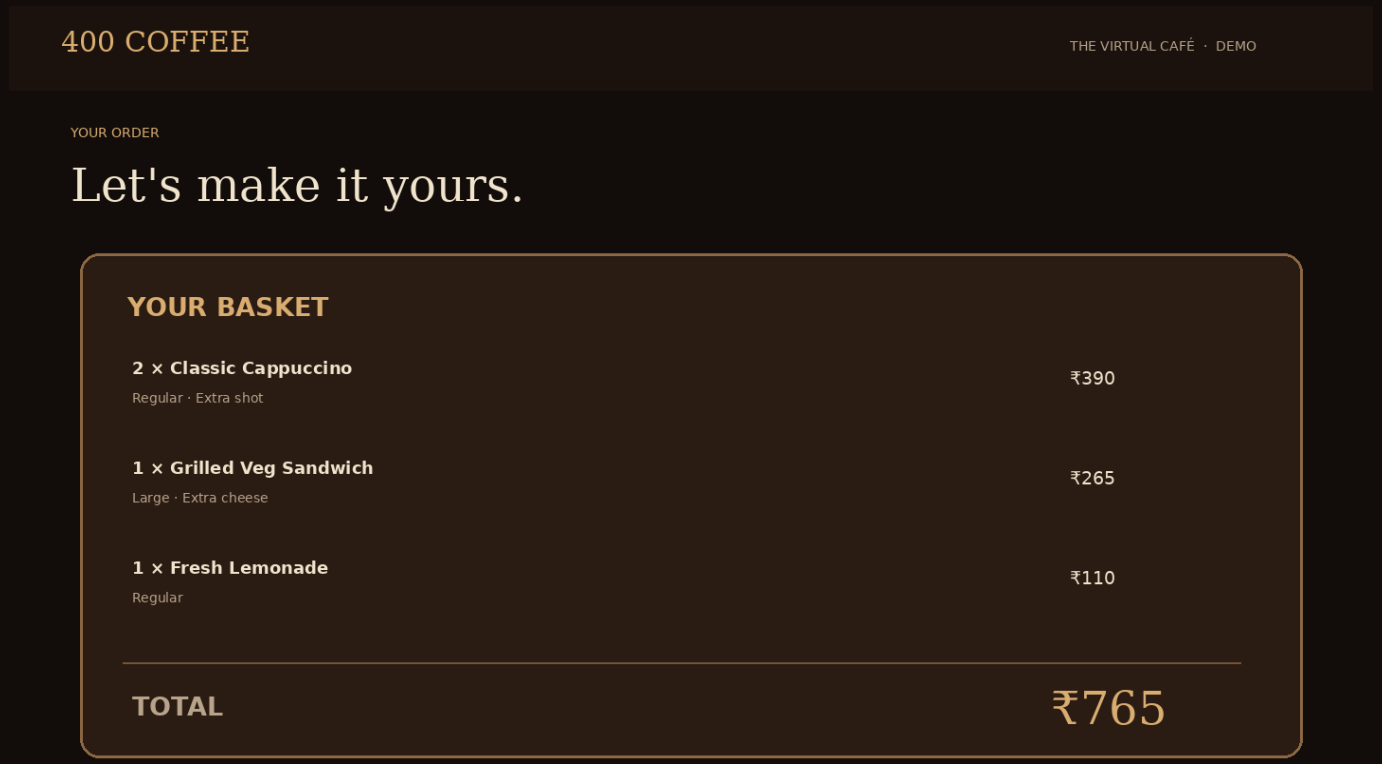

CUSTOMER CONTROL

- Choose size or variant where available.
- Add extras and see price changes.
- Enter preparation instructions such as less spicy or extra toasted.
- Server recalculates the final price before submission.

A clear basket. A confident confirmation.

Customers see exactly what they are ordering before submitting.

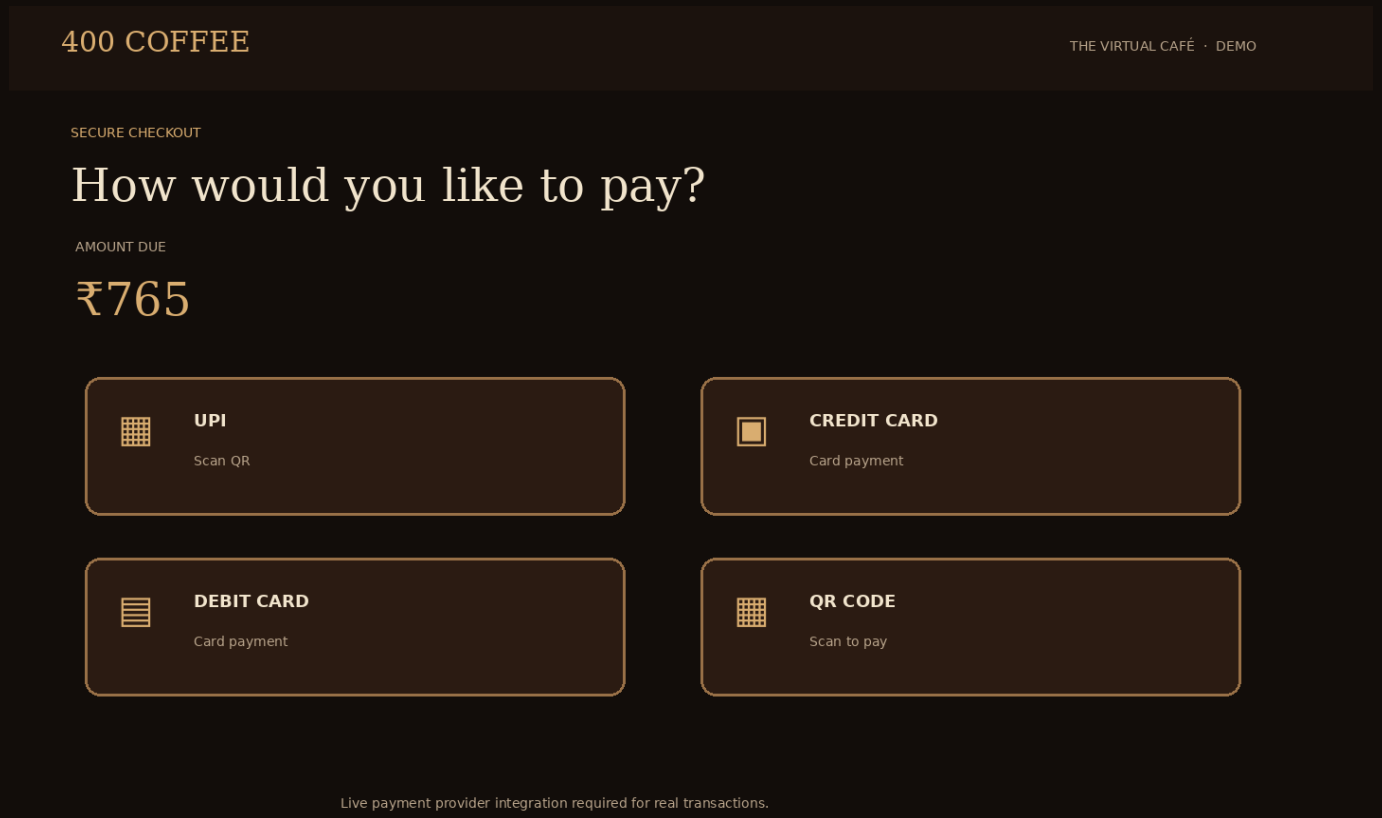

GUEST CHECKOUT

- Edit or remove basket items.
- Add name and mobile number.
- Review modifiers, notes, taxes/charges and total.
- Transactional WhatsApp consent is separate from marketing consent.

Pay now — or settle at the takeaway counter.

The customer chooses the payment path that suits the visit.

PAYMENT OPTIONS

- UPI and QR where configured.
- Credit and debit card through an approved provider.
- Pay at takeaway creates an unpaid order.
- Paid status appears only after server-side verification.

A customer order becomes an operationally visible order.

The customer experience connects to the café's cashier-led workflow.

CUSTOMER

Builds basket
Confirms details
Submits order

SHARED ORDER BACKEND

Validates totals
Creates order reference
Applies acceptance policy

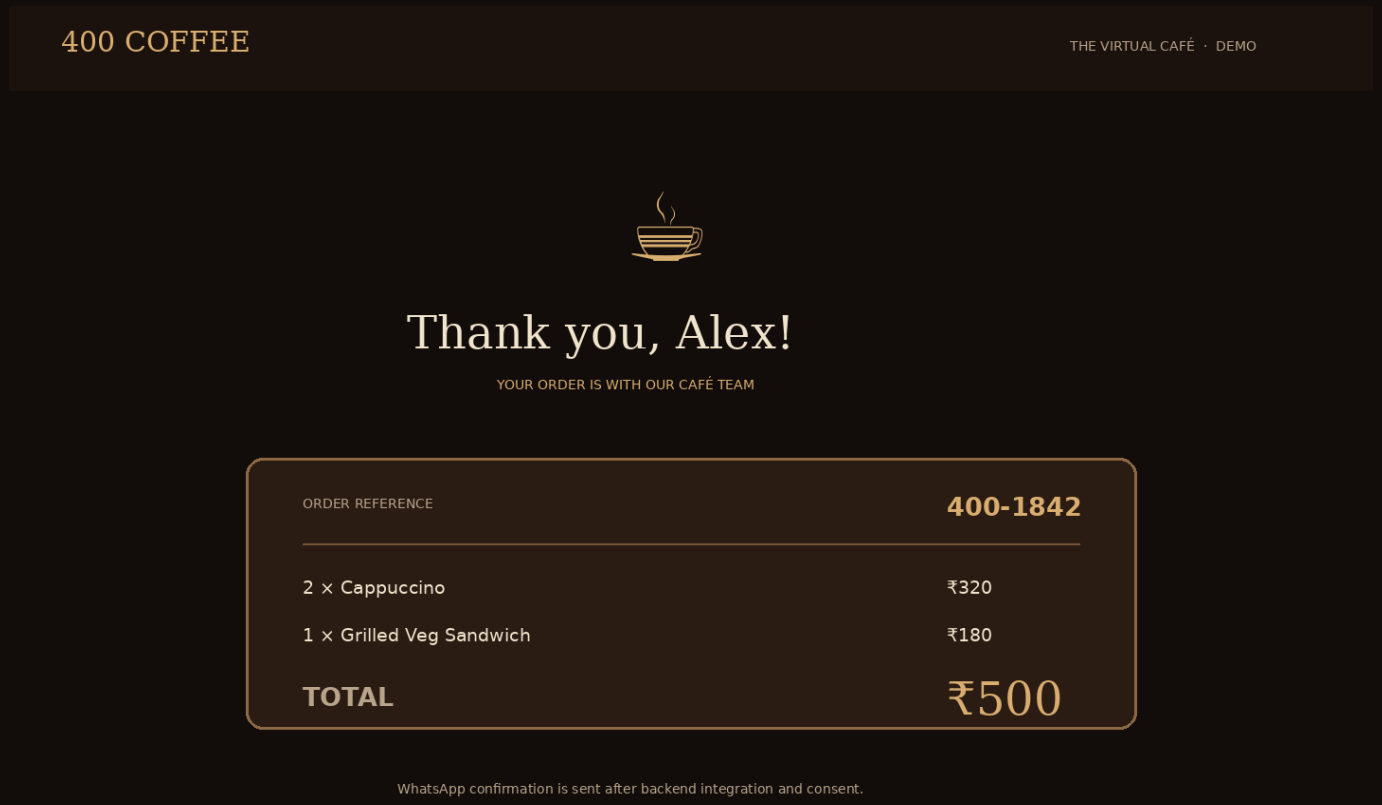

CAFÉ TEAM

Cashier accepts
Food & beverage stations prepare
Customer sees status

Order submitted ≠ accepted. Accepted ≠ paid. Payment and order states remain separate, auditable and server-authoritative.

A clear finish — and a clear next step.

The customer receives an order reference and accurate payment/order status.

AFTER SUBMISSION

- Unique order reference and item summary.
- Pay-at-counter clearly shows amount due.
- Pay-now shows paid only after verification.
- WhatsApp confirmation is sent through an approved Business Platform integration.

A distinctive customer layer, connected to a disciplined core.

Built to integrate with the broader 400 Coffee operating system.

Customer PWA

Mobile-first, no mandatory installation, QR entry and session recovery.

Catalog & pricing

Live menu, availability, variants, modifiers and server-side quotes.

Payments

Provider-hosted UPI/QR/card flows, verification and exception handling.

Notifications

Transactional WhatsApp templates, consent and delivery tracking.

Order handoff

Cashier acceptance policy, kitchen events and customer status updates.

Security & privacy

Guest session tokens, rate limits, minimal PII and auditable transitions.

Build the experience in tested, measurable slices.

The 3D layer never gets to compromise order correctness.

1 · EXPERIENCE FOUNDATION	Responsive PWA, brand system, scene, manager, 2D fallback.
2 · ORDER JOURNEY	Diary menu, customizer, basket, guest identity and review.
3 · TRANSACTIONS	Order submission, payment adapter, bill lookup and WhatsApp.
4 · HARDEN & PILOT	Device testing, accessibility, performance, security and acceptance.

Approve the experience. Confirm the integrations. Pilot with confidence.

Items to validate before a binding implementation baseline.

CLIENT INPUTS

- Final menu, prices, descriptions and product imagery.
- Brand assets and approval of manager/3D art direction.
- Fulfilment rules and cashier acceptance policy.
- Merchant payment provider and sandbox credentials.
- WhatsApp Business account and approved templates.
- Privacy, cancellation, refund and tax rules.

IMPORTANT ASSUMPTIONS

- Screens are illustrative concept UI, not deployed captures.
- Payment and WhatsApp require approved provider integration.
- Static UPI QR does not automatically verify a specific order.
- 3D performance and assets require device testing.
- Existing implementation estimates must be revalidated for the immersive scope.

Proposed next action: approve the screen journey and asset direction, then baseline scope, timeline and commercials.
